

ACRYPOL + HAS THE ANSWER

When an awkward, unidentifiable roof leak poses a problem, Acrypol +, from solutions specialists Acrypol Products has the answer.

Such was the case for Walshaw High School in Burnley, Lancashire, where the existing mastic asphalt roof, originally constructed during the 1950's leaked intermittently.

Lancashire County Council, who had previously specified Acrypol +, decided it was the most cost effective and dependable way to protect the school and its flat roof areas.

Acrypol + is the most advanced roof waterproofing solution available. It is tried and trusted by literally hundreds of Local Authorities and District Councils all over the UK – and is regularly asked for by name.

Acrypol + incorporates such an advanced chemical structure that it can be applied even during damp, un-predictable weather – it does not require the contractor to use heat, naked flame, adhesives or

bitumen on site, therefore reducing health and safety risks especially associated with buildings which must remain fully operational during refurbishment.

Acrypol + features a highly advanced “one-coat” structure. It gives immediate, tough, durable waterproof protection, stopping leaks and encapsulating the entire roof.

Any trapped moisture in the roofs substrate is allowed to evaporate harmlessly into the atmosphere and even the threat of damp, unpredictable weather will not stop the product’s unique compound from bonding immediately.

Acrypol + was originally launched 21 years ago and has remained a contractor favourite ever since. In a recent independent survey, Acrypol + was quoted as being the most reliable, quality product of it’s kind on the market. Acrypol + is available in Medium Grey or Solar White from leading builder’s merchants and specialist roofing merchants nationwide.
